

Low carbon welded mesh steel is usually made of high quality low carbon steel wire or stainless steel wire.

Varieties:

Low carbon welded mesh steel has kinds of forms, the most important ones are **galvanized after welded, galvanized before welded, hot-dipped galvanized, electro galvanized and PVC coated welded wire meshes.**

	<p>Galvanized After Welded Wire Mesh</p> <p>Galvanized After Welded - GAW - wire meshes and fences are strong and durable. These products are made by dipping previously welded mesh into a bath of molten zinc. The entire fence or mesh, including the welded areas, is thoroughly sealed and protected against rust and corrosion. Because it is covered with so much more zinc than GBW galvanized before welded wire fencing, it will last years longer.</p>
	<p>Galvanized Before Welded Wire Mesh</p> <p>Wires are galvanized before welding also referred to as GBW. The intersections of the welds will have less galvanized protection. Galvanized Before Welded wire meshes and fences are economical and ideal for many uses. The wires used in the manufacturing process are galvanized before they are welded into a variety of mesh sizes. Different gauge wires are used. The gauge and mesh sizes are determined by the final use of the product.</p>
	<p>Hot-dipped Galvanized Welded Wire Mesh</p> <p>Weld mesh is hot dip galvanised to the highest standards and conforms to BS EN 10244-2 Class A. Should a thicker coat be necessary, i.e. BS EN ISO 1461 (replaces BS729), this can be obtained on request.</p>
	<p>Electric Galvanized Welded Wire Mesh</p> <p>Electric galvanized welded wire mesh is made of high quality low carbon steel wire through automatic digital controlled welding equipments. It is welded with plain steel wire, then electric galvanized after welding. The</p>

finished products are level and flat with sturdy structure, it has beautiful appearance.

PVC Coated Welded Wire Mesh

PVC coated welded wire mesh is manufactured from bright drawn mild steel wire to BS1052. Electronically welded at every intersection, it is produced in self-colour which is lightly copper coated to help prevent rusting. We offer 2 qualities of galvanising as well as powder coating in your choice of colour and PVC.

Features:

Low carbon welded mesh steel is joined by resistance-welding (No filler metal used). Good quality in corrosion-resisting and oxidation-resisting.
